

## Section 1

Please answer all questions.

You could answer and copy your codes for the answers to this document and then send the file back to reviewer.

## Question 1

Assuming <http://codequiz.azurewebsites.net/data> returns an object {data: 10}.  
Below function doesn't work correctly.

```
function thisIsSyncFunction() {
  let result = 0;

  fetch('https://codequiz.azurewebsites.net/data').then(res => res.json()).then((response) =>
  {
    result = response.data;
  });
  return result;
}

const number1 = thisIsSyncFunction()
const calculation = number1 * 10;
console.log(calculation);
```

- 1.1 Please correct the code, so it really prints out the expected result (100). You can fix it anyway you like but it still has to call fetch as the source of data.

```
function thisIsSyncFunction() {
  let result = 0;

  return fetch('https://codequiz.azurewebsites.net/data')
    .then(response => response.json())
    .then((response) => {
      return result = response.data;
    })
}

thisIsSyncFunction().then((number1) => {
  const calculation = number1 * 10;
  console.log(calculation);
})
```

1.2 Is there a way to make **thisIsSyncFunction** really synchronous, so number1 has the value 10 before it is used for the calculation on the next line.

```
function thisIsSyncFunction() {  
    let result = 0;  
  
    return fetch('https://codequiz.azurewebsites.net/data')  
        .then(response => response.json())  
        .then((response) => {  
            return result = response.data;  
        })  
}  
  
thisIsSyncFunction().then((number1)=> {  
    let number_api = number1;  
    const calculation = number_api * 10;  
    console.log(calculation);  
  
})
```

## Question 2

From this code <https://codepen.io/domrongpon-tanpaibul/pen/ExgVrPJ>  
, please provide the CSS that move the start to the middle of the box.

The solution:

```
9
10 ~ .star {
11     position: absolute;
12 ~ /* Only allow to add content inside this
    block */
13     left: 0;
14     right: 0;
15     text-align: center;
16 ~ /* */
17 }
```

The result:

### Quiz: Move a star to middle of the box.

### Question 3

From this code, <https://codepen.io/domrongpon-tanpaibul/pen/YzGyBZq?editors=1010>, please make the box not close when click close button. You should not modify the DOM elements in this page, but rather achieve this by handling the event.

*Note that you can only add code inside Quiz block in JS section but can't modify class MyDlg.*

```

/* Quiz: Write code to prevent dialog to close when click
close button */
const dlg = document.getElementById('dlg');
dlg.addEventListener("click", function(event){

document.querySelector("#container").style.display="block";
});
/****/

```

#### Question 4

From this code, <https://codepen.io/domrongpon-tanpaibul/pen/zYKvboB>, please write code to show RGB code that users clicked inside the answer box. Please consider the efficiency of the code as well.

```

8  const colorPicker = document.getElementById('colorPicker');
9
10 colorPicker.addEventListener("click", function(event){
11   document.getElementById("answerBox").style.backgroundColor =
    event.path[0].outerText;
12
13 });
14

```

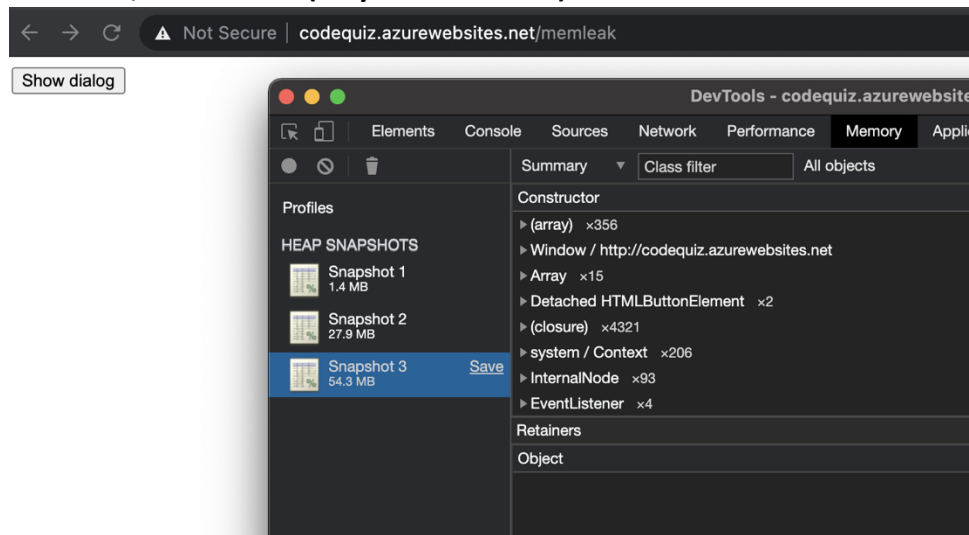

## Question 5

Find the memory leak in this application <http://codequiz.azurewebsites.net/memleak>

When ever user open a dialog, and close it, a memory will keep increased around 25 MBs per round. Please identify what is causing the memory leak, and how to fix it and describe how you investigate it.

**\*\* Please note that the big array in the code was added intentionally, to make it easier to see the leak.**

**This array should be cleared by browser GC when the dialog is closed, and element is removed from DOM, but it is not (why is it the case?)**

```
← → ↻ Not Secure | view-source:codequiz.azurewebsites.net/memleak
line wrap ☐
1 <div id="mainContainer"></div><script>function showDialog() {
2   const newDialog = document.createElement('div');
3   newDialog.style.border = 'solid 1px black';
4   newDialog.style.position = 'absolute';
5   newDialog.style.width = '100%';
6   newDialog.style.height = '100%';
7   newDialog.style.top = '0px';
8   newDialog.style.background = 'white';
9
10  const closeBtn = document.createElement('button');
11  const dialogText = document.createElement('div');
12  newDialog.appendChild(closeBtn);
13  newDialog.appendChild(dialogText);
14  dialogText.innerText = 'This is a dialog';
15  closeBtn.innerText = 'Close';
16  document.addEventListener('click', function (e) {
17    if (e.target === closeBtn) {
18      newDialog.parentElement.removeChild(newDialog);
19    }
20  });
21
22  //do not remove this part, it is for the ease of leak identification
23  const tmp = [];
24  for(let i = 1; i < 5000000; i++) {
25    tmp.push(i);
26  }
27  closeBtn.tmp = tmp;
28  //end
29  document.body.appendChild(newDialog);
30 }
31 </script><button onclick="showDialog()">Show dialog</button>
```

According to red box on figure above. I think the problem of memory leak in this application is there are many number push in the array tmp. In my solution, i think i will not for loop to display values like this. I will use lazy load for handle it. I think it should be better and solve this problem.

## Section 2

Please commit the codes to your personal git repository and send the links to the git repositories back to the reviewer.

Github for section 2:

## Question 1

Please create a web application following below specs.

- Angular framework is preferred, but you can also use your preferred framework, or pure javascript/HTML5
- Page consist of 3 columns, first column has fixed width of 200px, last column has fixed width of 300px, the middle column expand/shrink to fill the remaining space of the page, and should be at least 100px. If window is smaller than 600px, show the scrollbar.
- In the first column, create an input field, where user can enter any number. If the value entered by users are not integer, round it to the nearest integer. If user enter negative values, replace it with 1.
- In the second column, show a drop down, which user can choose what calculation between “isPrime” and “isFibonacci” he wants to calculate, default the value to isPrime.
  - isPrime: calculate whether the input is a prime number, show true in Col3 if the number is prime, and false in the other case
  - IsFibonacci: calculate whether the input is a fibonacci number, show true in Col3 if the number is a fibonacci number, and false in the other case.
- Whenever the value in input box in column1, or the dropdown in column2 changes, execute the calculation accordingly, and show the result in column 3.

Github: [https://github.com/nunthawat-2021/Refinitiv\\_Test/blob/main/section2/question1.html](https://github.com/nunthawat-2021/Refinitiv_Test/blob/main/section2/question1.html)

The screenshot shows a web browser window with the address bar displaying the URL: `File | /Users/nunthawatthasiw/2022_refinitive_test.html`. The browser interface includes back, forward, and refresh buttons. The main content area is divided into three vertical sections. The leftmost section contains a single-line text input field. The middle section contains a dropdown menu with the text "Please Select" and a downward arrow. The rightmost section is currently empty.

## Question 2

Create a web app with an input for using as filter and a table for display the result. The app need to get data from <https://api.publicapis.org/categories> for using for displaying in the result table.

Result table

- By default display all data from categories

Filtering

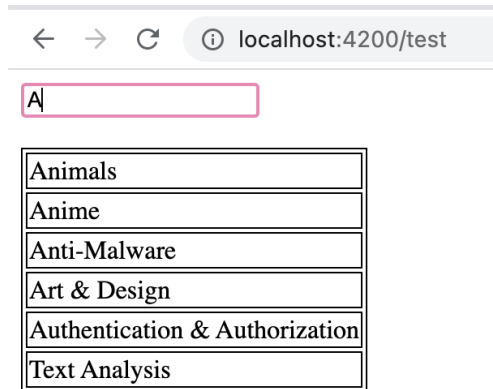

- When user type any text in the input box, the result table should be filter to display only the result that contains the text.

### NOTE

- The app could created with any framework but Angular is preferred

Github: [https://github.com/nunthawat-2021/Refinitiv\\_Test/tree/main/section2/question2](https://github.com/nunthawat-2021/Refinitiv_Test/tree/main/section2/question2)

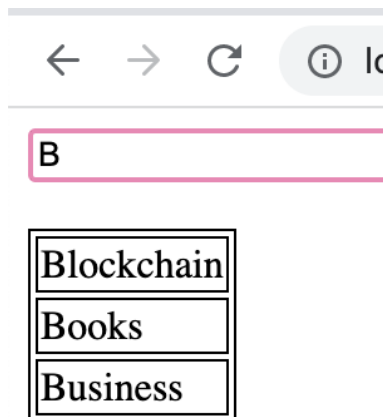

My result 1:

A screenshot of a web browser interface. The address bar shows 'localhost:4200/test'. Below the address bar is a search input field containing the letter 'A'. To the right of the input field is a list of search results, each in a rectangular box. The results are: Animals, Anime, Anti-Malware, Art & Design, Authentication & Authorization, and Text Analysis.

Animals
Anime
Anti-Malware
Art & Design
Authentication & Authorization
Text Analysis

My result 2:

A screenshot of a web browser interface. The address bar shows 'localhost:4200/test'. Below the address bar is a search input field containing the letter 'B'. To the right of the input field is a list of search results, each in a rectangular box. The results are: Blockchain, Books, and Business.

Blockchain
Books
Business

### Question 3

Write a node.js code that retrieve NAV (Net Asset Value) of a Fund from this website  
<https://codequiz.azurewebsites.net/>

The code should be in a single js file, and can be run using “node yourfile.js FUNDCODE” using node 12. After running “node yourfile.js BEQSSF” we should get BEQSSF nav print out in the

console (11.247), similiary running “node yourfile.js BM70SSF” should print out 9.9774 .
